

3 SUSY Lagrangians Part II

3.1 SUSY Yang-Mills

$$\delta_{\text{gauge}} A_\mu^a = -\partial_\mu \Lambda^a + g f^{abc} A_\mu^b \Lambda^c \quad (3.1)$$

$$\delta_{\text{gauge}} \lambda^a = g f^{abc} \lambda^b \Lambda^c \quad (3.2)$$

where Λ^a is an infinitesimal gauge transformation parameter, g is the gauge coupling, and f^{abc} are the antisymmetric structure constants

	Off Shell	On Shell
A_μ^a	3 d.o.f.	2 d.o.f.
$\lambda_\alpha, \lambda_\dot{\alpha}^\dagger$	4 d.o.f.	2 d.o.f.

(3.3)

Book-keeping trick: add a real auxillary boson field D

	Off Shell	On Shell
D	1 d.o.f.	0 d.o.f.

(3.4)

$$\mathcal{L}_{\text{SYM}} = -\frac{1}{4} F_{\mu\nu}^a F^{\mu\nu a} + i \lambda^{\dagger a} \bar{\sigma}^\mu D_\mu \lambda^a + \frac{1}{2} D^a D^a \quad (3.5)$$

where

$$F_{\mu\nu}^a = \partial_\mu A_\nu^a - \partial_\nu A_\mu^a - g f^{abc} A_\mu^b A_\nu^c \quad (3.6)$$

and

$$D_\mu \lambda^a = \partial_\mu \lambda^a - g f^{abc} A_\mu^b \lambda^c \quad (3.7)$$

$$\delta A_\mu^a = -\frac{1}{\sqrt{2}} [\epsilon^\dagger \bar{\sigma}_\mu \lambda^a + \lambda^{\dagger a} \bar{\sigma}_\mu \epsilon] \quad (3.8)$$

$$\delta \lambda_\alpha^a = -\frac{i}{2\sqrt{2}} (\sigma^\mu \bar{\sigma}^\nu \epsilon)_\alpha F_{\mu\nu}^a + \frac{1}{\sqrt{2}} \epsilon_\alpha D^a \quad (3.9)$$

$$\delta \lambda_\alpha^{\dagger a} = \frac{i}{2\sqrt{2}} (\epsilon^\dagger \bar{\sigma}^\nu \sigma^\mu)_\alpha F_{\nu\mu}^a + \frac{1}{\sqrt{2}} \epsilon_\alpha^\dagger D^a \quad (3.10)$$

$$\delta D^a = \frac{-i}{\sqrt{2}} [\epsilon^\dagger \bar{\sigma}^\mu D_\mu \lambda^a - D_\mu \lambda^{\dagger a} \bar{\sigma}^\mu \epsilon]. \quad (3.11)$$

$$(\delta_{\epsilon_2}\delta_{\epsilon_1} - \delta_{\epsilon_1}\delta_{\epsilon_2})X = -i(\epsilon_1\sigma^\mu\epsilon_2^\dagger - \epsilon_2\sigma^\mu\epsilon_1^\dagger)D_\mu X^a \quad (3.12)$$

for $X^a = F_{\mu\nu}^a$, λ^a , $\lambda^{\dagger a}$, D^a , this requires the identities:

$$\xi\sigma^\mu\bar{\sigma}^\nu\chi = \chi\sigma^\nu\bar{\sigma}^\mu\xi = (\chi^\dagger\bar{\sigma}^\nu\sigma^\mu\xi^\dagger)^* = (\xi^\dagger\bar{\sigma}^\mu\sigma^\nu\chi^\dagger)^*; \quad (3.13)$$

$$\bar{\sigma}^\mu\sigma^\nu\bar{\sigma}^\rho = -\eta^{\mu\rho}\bar{\sigma}^\nu + \eta^{\nu\rho}\bar{\sigma}^\mu + \eta^{\mu\nu}\bar{\sigma}^\rho + i\epsilon^{\mu\nu\rho\kappa}\bar{\sigma}_\kappa; \quad (3.14)$$

$$\sigma_{\alpha\dot{\alpha}}^\mu\bar{\sigma}_\mu^{\dot{\beta}\beta} = 2\delta_\alpha^\beta\delta_{\dot{\alpha}}^{\dot{\beta}}. \quad (3.15)$$

3.2 SUSY Gauge Theories

Add chiral supermultiplets in a gauge representation with hermitian matrices $(T^a)_i{}^j$

$$[T^a, T^b] = if^{abc}T^c. \quad (3.16)$$

$$\delta_{\text{gauge}}X_j = ig\Lambda^a(T^aX)_j \quad (3.17)$$

for $X_j = \phi_j, \psi_j, F_j$

covariant derivatives:

$$D_\mu\phi_j = \partial_\mu\phi_j + igA_\mu^a(T^a\phi)_j \quad (3.18)$$

$$D_\mu\phi^{*j} = \partial_\mu\phi^{*j} - igA_\mu^a(\phi^*T^a)^j \quad (3.19)$$

$$D_\mu\psi_j = \partial_\mu\psi_j + igA_\mu^a(T^a\psi)_j. \quad (3.20)$$

New renormalizable interactions

$$(\phi^*T^a\psi)\lambda^a, \quad \lambda^{\dagger a}(\psi^\dagger T^a\phi) \quad \text{and} \quad (\phi^*T^a\phi)D^a. \quad (3.21)$$

$$\delta\phi_j = \epsilon\psi_j \quad (3.22)$$

$$\delta(\psi_j)_\alpha = -i(\sigma^\mu\epsilon^\dagger)_\alpha D_\mu\phi_j + \epsilon_\alpha F_j \quad (3.23)$$

$$\delta F_j = -i\epsilon^\dagger\bar{\sigma}^\mu D_\mu\psi_j + \sqrt{2}g(T^a\phi)_j\epsilon^\dagger\lambda^{\dagger a}. \quad (3.24)$$

$$\begin{aligned} \mathcal{L} = & \mathcal{L}_{\text{SYM}} + \mathcal{L}_{\text{WZ}} \\ & -\sqrt{2}g\left[(\phi^*T^a\psi)\lambda^a + \lambda^{\dagger a}(\psi^\dagger T^a\phi)\right] \\ & + g(\phi^*T^a\phi)D^a. \end{aligned} \quad (3.25)$$

Here \mathcal{L}_{WZ} means the chiral supermultiplet lagrangian in Eq. 2.58, but with gauge-covariant derivatives, For the theory to be gauge invariant we must have a gauge invariant superpotential i.e.

$$\delta_{\text{gauge}} W \propto W^i (T^a \phi)_i = 0. \quad (3.26)$$

D^a equation of motion:

$$D^a = -g(\phi^* T^a \phi). \quad (3.27)$$

thus the scalar potential is:

$$V(\phi, \phi^*) = F^{*i} F_i + \frac{1}{2} D^a D^a = W_i^* W^i + \frac{1}{2} g^2 (\phi^* T^a \phi)^2. \quad (3.28)$$

$$V(\phi, \phi^*) \geq 0 \quad (3.29)$$

We have the following types of Feynman veritces:

Figure 1: Yang-Mills interactions.

Figure 2: Interactions required by gauge invariance.

Figure 3: Additional interactions required by gauge invariance and supersymmetry: gaugino-fermion-scalar coupling and $(\text{scalar})^2$ auxillary field coupling which become a quartic coupling after integrating out the auxilary field.

Figure 4: The dimensionless non-gauge interaction vertices in a supersymmetric theory: (a) scalar-fermion-fermion Yukawa interaction y^{ijk} , (b) quartic scalar interaction $y^{ijn}y_{kln}^*$.

using the Noether theorem we find the conserved supercurrent:

$$\begin{aligned} J_\alpha^\mu = & (\sigma^\nu \bar{\sigma}^\mu \psi_i)_\alpha D_\nu \phi^{*i} - i(\sigma^\mu \psi^{\dagger i})_\alpha W_i^* \\ & - \frac{1}{2\sqrt{2}}(\sigma^\nu \bar{\sigma}^\rho \sigma^\mu \lambda^{\dagger a})_\alpha F_{\nu\rho}^a - \frac{i}{\sqrt{2}}g\phi^* T^a \phi (\sigma^\mu \lambda^{\dagger a})_\alpha, \end{aligned} \quad (3.30)$$
